

# CYBER SECURITY INTERNSHIP REPORT

Name: Srinal P Naik

Domain: Cyber Security

## **TASK 1: Vulnerability Assessment**

1. Introduction: This report analyzes a test website for security vulnerabilities.
2. Target Website : <http://testasp.vulnweb.com>
3. Tools Used - Web Browser - Developer Tools
4. Findings - Website uses HTTP (not secure) - Missing security headers - Input validation issues
5. Risk Level Medium
6. Conclusion : The website has some vulnerabilities that need improvement.

## **TASK 2: Phishing Email Detection**

1. Introduction: This report analyzes email samples to detect phishing attempts and improve awareness.
2. Objective: To identify phishing emails and educate users about prevention.
3. Tools Used:
  - Manual Analysis
  - Browser inspection
4. Email Analysis:

Email 1: Subject: Urgent! Your bank account will be suspended Sender Email: [support@secure-bank-login.xyz](mailto:support@secure-bank-login.xyz) (Suspicious)

- Contains urgent message

- Uses fake link (<http://secure-bank-login.xyz>)
- Generic greeting → Classified as PHISHING

Email 2: Subject: Monthly Bank Statement Sender Email: [official@bank.com](mailto:official@bank.com)  
(Legitimate)

- Legitimate message
- No suspicious links → Classified as SAFE

#### 5. Phishing Indicators:

- Urgent language
- Suspicious links
- Generic greetings
- Threatening tone

#### 6. Prevention Tips:

- Do not click unknown links
- Check sender email carefully
- Verify URLs before entering data
- Use official apps/websites

7. Conclusion: Phishing emails can trick users into revealing sensitive information. Awareness is key to prevention.

## TASK 3: API Security Risk Analysis

1. Introduction: This report analyzes a sample API to identify potential security risks.
2. Objective: To evaluate API security and identify risks.
3. Tools Used:
  - Browser
  - Manual Testing
4. API Tested: <https://jsonplaceholder.typicode.com/posts>
5. Findings:

- API does not require authentication (no login needed)
  - Data is publicly accessible (userId, title, body)
  - No rate limiting observed
  - No visible input validation
6. Risk Level: Medium
7. Impact:
- Anyone can access data
  - Risk of misuse
  - Possible automated attacks
8. Solution:
- Add authentication (API keys)
  - Restrict access
  - Implement rate limiting
  - Validate inputs
9. Conclusion: The API has security weaknesses that should be fixed.

## CONCLUSION:

This internship helped me understand cybersecurity concepts such as vulnerability assessment, phishing detection, and API security risks.
